COMICCRAFT — PROPOSED SOLUTION

==========

OVERVIEW

ComicCraft is a two-layer application:

1. FastAPI backend that handles AI generation (text + images)

2. HTML/Jinja2 frontend that provides a clean input form and preview

USER FLOW

Step 1: User opens http://127.0.0.1:8000 in the browser

Step 2: Fills the form (story prompt, character, setting, tone, art style)

Step 3: Clicks "Generate Comic"

Step 4: Backend pipeline runs:

a) generate_outline() → Gemini creates 5-panel JSON outline

b) generate_story() → Gemini writes narration for all panels

c) generate_image() → Pollinations creates 5 images

d) split_story_by_panel() → Splits narration into 5 chunks

Step 5: Backend renders comic_preview.html with all panel data

Step 6: User sees the complete 5-panel comic

Step 7: User can save/export as PDF

KEY FEATURES

- 5 AI-generated comic panels

- Unique illustration for each panel

- Coherent story from panel 1 to panel 5

- Live progress as each image finishes

- PDF export
